# CMSC 440 - Homework Assignment #5 (No Submission/Not Graded)

**Due Date:** No Submission is Required!

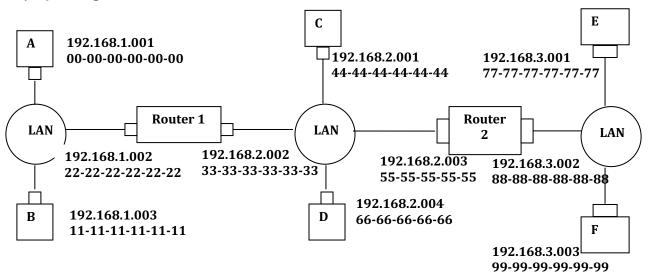

## **Questions:**

You are required to answer the following questions from the attached document:

Question
P.14
P.15
P.19
P.21

#### Problem 14

a), b) See figure below.

- c)
- 1. Forwarding table in E determines that the datagram should be routed to interface 192.168.3.002.
- 2. The adapter in E creates and Ethernet packet with Ethernet destination address 88-88-88-88-88.
- 3. Router 2 receives the packet and extracts the datagram. The forwarding table in this router indicates that the datagram is to be routed to 198.162.2.002.
- 4. Router 2 then sends the Ethernet packet with the destination address of 33-33-33-33-33 and source address of 55-55-55-55-55 via its interface with IP address of 198.162.2.003.
- 5. The process continues until the packet has reached Host B.

d) ARP in E must now determine the MAC address of 198.162.3.002. Host E sends out an ARP query packet within a broadcast Ethernet frame. Router 2 receives the query packet and sends to Host E an ARP response packet. This ARP response packet is carried by an Ethernet frame with Ethernet destination address 77-77-77-77-77.

#### Problem 15

a) No. E can check the subnet prefix of Host F's IP address, and then learn that F is on the same LAN. Thus, E will not send the packet to the default router R1.

Ethernet frame from E to F:

Source IP = E's IP address

Destination IP = F's IP address

Source MAC = E's MAC address

Destination MAC = F's MAC address

b) No, because they are not on the same LAN. E can find this out by checking B's IP address.

Ethernet frame from E to R1:

Source IP = E's IP address

Destination IP = B's IP address

Source MAC = E's MAC address

Destination MAC = The MAC address of R1's interface connecting to Subnet 3.

c) Switch S1 will broadcast the Ethernet frame via both its interfaces as the received ARP frame's destination address is a broadcast address. And it learns that A resides on Subnet 1 which is connected to S1 at the interface connecting to Subnet 1. And, S1 will update its forwarding table to include an entry for Host A.

Yes, router R1 also receives this ARP request message, but R1 won't forward the message to Subnet 3.

B won't send ARP query message asking for A's MAC address, as this address can be obtained from A's query message.

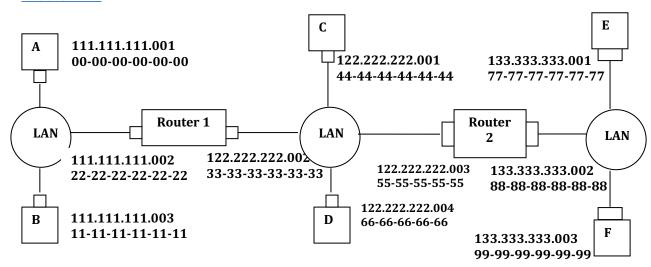

Once switch S1 receives B's response message, it will add an entry for host B in its forwarding table, and then drop the received frame as destination host A is on the same interface as host B (i.e., A and B are on the same LAN segment).

#### Problem 19

Time, t	Event
0	A and $B$ begin transmission
245	A and $B$ detect collision
293	A and $B$ finish transmitting jam signal
293+245 = 538	B's last bit arrives at $A$ ; $A$ detects an idle
538+96=634	channel
	A starts transmitting
293+512 = 805	B returns to Step2
	B must sense idle channel for 96 bit times before
	it transmits
634+245=879	A's transmission reaches B

Because A's retransmission reaches B before B's scheduled retransmission time (805+96), B refrains from transmitting while A retransmits. Thus A and B do not collide. Thus the factor 512 appearing in the exponential backoff algorithm is sufficiently large.

### Problem 21

i) from A to left router: Source MAC address: 00-00-00-00-00

Destination MAC address: 22-22-22-22-22

Source IP: 111.111.111.001 Destination IP: 133.333.333.003

ii) from the left router to the right router: Source MAC address: 33-33-33-33-33

Destination MAC address: 55-55-55-55-55

Source IP: 111.111.111.001 Destination IP: 133.333.333.003

iii) from the right router to F: Source MAC address: 88-88-88-88-88

Destination MAC address: 99-99-99-99-99

Source IP: 111.111.111.001 Destination IP: 133.333.333.003
